

Abstract

Novel Construction of a Spinner Key Chain Fob

5 A method for constructing a spinner key chain fob
comprising an outer housing and one or more independently
rotating members affixed within the housing wherein the
rotating member has two cavities diametrically opposed on
its perimeter edge; the housing has an internal perimeter,
10 an external perimeter, an aperture extending through the
internal perimeter to the external perimeter and a center
post diametrically opposed to the aperture; the internal
perimeter able to receive the rotating member comprising
the steps of: inserting the center post into one cavity of
15 the one or more rotating members; and affixing a pin within
the aperture such that the pin extends through the key
chain housing into the remaining cavity of the one or more
rotating members such that when they are impacted they
rotate freely.
